hello@ramonclaudio.com

Developer tools engineer in New York. 13 years shipping software. CLIs and build tooling. 63 PRs merged upstream to Expo, React Native, Convex, Bun, shadcn/ui, and others.

EXPERIENCE

Software Engineer

2013 to Present · Brooklyn, NY

- 63 PRs merged upstream across 12 repos: expo/expo (36), shadcn-ui/ui (5), get-convex/better-auth (5), better-auth (3), hermes (3), fumadocs (2), withastro/compiler-rs (2), react-native (3), plus bun, TanStack/db, napi-rs, and App-Store-Connect-CLI. 4 more open across 4 repos: bun.lock determinism in oven-sh/bun, session preservation on password change in better-auth, a pasted-control-character fix in the shadcn-ui/ui CLI, and a codegen ref-type backport in microsoft/react-native-macos.
- Build and maintain tanstack-cn (CLI scaffolder, ~1,300 downloads), create-claude (1,870+ downloads), convex-revenuecat (21,500+ npm downloads, listed on the Convex Components Directory), and 8 other shipped npm packages, 34,000+ downloads across all of them.
- Maintain ramonclaudio/patches (70 patches for Bun, npm, pnpm, and Yarn) so my apps and other users ship the fix while upstream PRs are in review.
- 11,600+ GitHub contributions since Dec 2023 across 53 public repos (394 stars earned).
- 2018 to 2021 at This Is Not Art: built and maintained a custom Shopify storefront (Liquid) with anti-bot protections (velocity detection, duplicate-order blocking, URL gating) years before Shopify shipped native mitigation. Built internal tools: AR sculpture preview app, Instagram head-tracking game, inventory management, custom event registration with timeslot booking.
- 2013 to 2017 at Software Automation Services: designed and operated automation and monitoring infrastructure for the e-commerce sector, with hands-on application security research and API reverse-engineering. Shipped Python and JavaScript tooling, Chrome extensions, and related web services.

Selected merged PRs

- better-auth/better-auth#9281**: ported `./instrumentation` to conditional exports after Convex's V8 isolate threw synchronously from `import()`. Verified by reading convex-backend's Rust isolate.
- get-convex/better-auth**: 5 merged PRs including #323 (breaking migration to better-auth 1.6, five runtime breaks in one rebase), #218 (stale credentials after session expiry), and #267 (`fetchAccessToken` deduplication).
- expo/expo#46714**: an internal SwiftUI font pin silently dropped font, `dynamicTypeSize`, and `resizable` on `@expo/ui`'s `Image`. Rerouted through the modifier pipeline so SF Symbols scale with Dynamic Type.
- withastro/compiler-rs#25 + napi-rs#3189**: root-caused the glibc incompatibility breaking Astro deploys on Vercel and Amazon Linux 2023: a zigbuild baseline in Astro's Rust compiler CI and a silent `--cross-compile` fallback in `@napi-rs/cli`. Shipped in `@astrojs/compiler-rs@0.1.8`.
- expo/expo#45872**: `<Host modifiers={...}>` was a silent no-op on iOS: Swift never declared the field the TS side forwarded. One field plus one `.applyModifiers` chain restored the whole modifier surface.
- expo/expo @expo/ui SwiftUI**: the rest of the surface: the SwiftUI `Alert` component, worklet-backed `scrollPosition` bindings, scroll anchors and snap paging, `clipShape/mask`, per-axis `scaleEffect`, `textContentType`, `textInputAutocapitalization`, Dynamic Type font, and the accessibility modifiers, plus the canary packaging fix and a fork-safety CI sweep.
- shadcn-ui/ui**: 5 merged PRs including #10396 (TanStack Start dark mode guide, replacing 4 prior attempts), #9484 (ComponentsList Copy-Page fix), and #10337 (llms.txt audit of 97 URLs).
- facebook/hermes#2047 + react/react-native#57518**: fixes landed in Meta's Hermes and React Native core through the internal codesync import: the armv7 CI job that failed on any fork not named hermes, and the TurboModule `ArrayBuffer` test that had never compiled on OSS main.

SELECTED PROJECTS

- seetree**: terminal tree viewer written in Zig. Tails JSONL session logs and lights up files as they get read, written, edited, or deleted. Hand-rolled JSONL scanner and direct POSIX calls instead of `std.process.spawn`, so the binary fits at or around 200K. On Homebrew and npm.
- cbase**: local log indexer. Parses a session directory into SQLite with full-text search across every project, plus a dashboard over the result. `cbase mv` rewrites the absolute paths that break history when a project directory moves.
- gitbar**: menubar GitHub dashboard on Tauri. Three parallel GraphQL queries plus REST events instead of one blocking call, progressive rendering, stale-while-revalidate caching. ~5MB binary.
- CLI scaffolders**: tanstack-cn puts up TanStack Start on Vite 8 Rollup+Oxc, Tailwind v4, and Oxc+Oxlint+Oxfmt, with package-manager detection and git init. create-claude and create-codex wire agent config into an existing project. ~3,500 downloads across them.
- vexpo**: Expo + Convex + Better Auth starter paired with a CLI that does the setup. create-vexpo scaffolds the template, then vexpo full provisions Convex, Apple Developer and ASC, EAS, and Resend end-to-end: account auth, secrets, env mirroring, Sign In With Apple JWT signing with 90-day auto-rotation, and EAS workflows.
- convex-revenuecat**: Convex component mirroring RevenueCat subscription state. Webhook and REST sync with lifecycle hooks for entitlement transitions. ~21,500 npm downloads, listed on the Convex Components Directory.

SKILLS

TypeScript, JavaScript, Python, HTML, CSS, React, React Native, Expo, Convex, Node, Bun, SwiftUI.

EDUCATION

B.S. Computer Science, Long Island University, 2016
